经典分子动力学的特点

1. 适合原子数较多的体系, 联系宏观现象和微观表现, 如蛋白质等

structure variability within a protein family

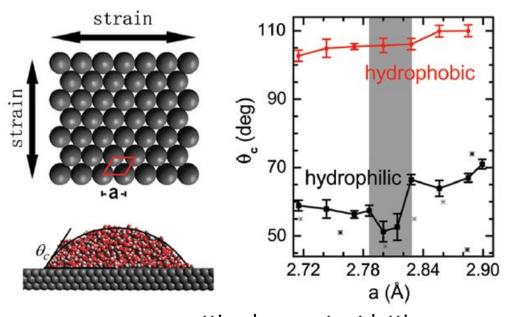

Adv. Appl. in Bioinf. Chem., 2015.

coalescence of two cylindrical droplets (R=58.5 nm) *PRL 122, 104501 (2019).*

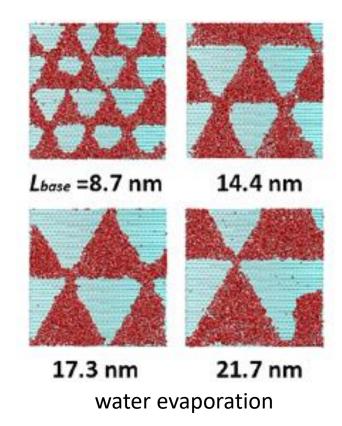

经典分子动力学的特点

2. 适合研究原子分子尺度的性质和机理

PRL 115, 195901 (2015).

分子动力学的原理

• 动力学: 研究作用于物体的力与物体运动的关系

• 分子动力学: 原子分子体系的多粒子动力学行为

多粒子体系的牛顿第二定律:

$$m_i \frac{\partial^2 \boldsymbol{r}_i}{\partial t^2} = \boldsymbol{F}_i, \ i = 1 \dots N.$$

m_i: 第i个粒子的质量

 r_i : 第i个粒子的位置

 F_i : 第i个粒子的受力

力的来源和势能

$$oldsymbol{F}_i = -rac{\partial V}{\partial oldsymbol{r}_i}$$

V: 势能总和, 一般主要是范德瓦尔斯势和库伦势

$$V = 4\varepsilon \left[\left(\frac{\sigma}{r_{ij}} \right)^{12} - \left(\frac{\sigma}{r_{ij}} \right)^{6} \right] + \sum_{i,j} f \cdot \frac{q_{i}q_{j}}{r_{ij}}.$$

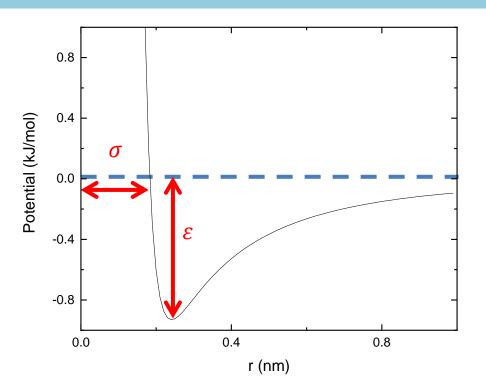

$$I_{append} I_{append}$$

Lennard-Jones (L-J) potential

Coulomb potential

Lennard-Jones (L-J) potential: short range interaction

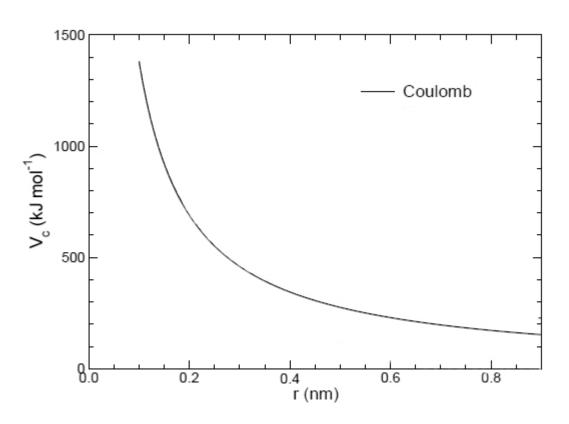

$$V_{LJ} = 4\epsilon \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^{6} \right].$$

r减小,V_{LJ}迅速增大(~r¹²); r>1.0 nm, V_{LJ}迅速减小(~r⁶);

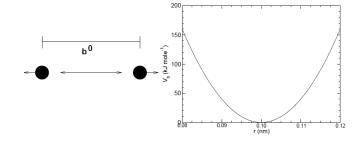

Coulomb potential: long-range interaction

$$V_{C} = f \cdot \frac{q1 \, q2}{r}.$$

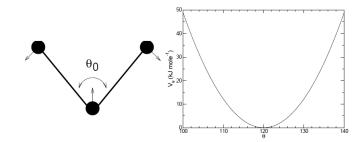

成键部分作用:决定分子类型

bond interaction

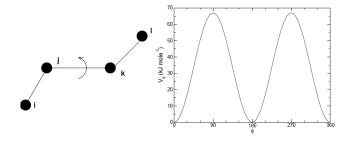

angle interaction

dihedral interaction

分子动力学的计算思路

Newton's Equations of motion

$$F_i = m_i \cdot a_i = m_i \cdot \frac{dv_i}{dt} = m \cdot \frac{d^2r_i}{dt^2}$$

$$F_i = -\nabla_i V$$

- Position, speed and acceleration are functions of time $r_i(t)$; $v_i(t)$; $a_i(t)$
- The force is related to the acceleration and, in turn, to the potential energy
- Integration of the equations of motion => initial structure : $r_i(t=0)$; initial distribution of velocities: $v_i(t=0)$

从加速度到位置变化:以一维为例

Acceleration:

$$a = \frac{dv}{dt}$$

If a is constant a≠f(t)

$$v(t) = at + v_0$$

• Speed:

$$v(t) = \frac{dx(t)}{dt}$$

Position:

• The trajectory x(t) obtained by integration taking into account the initial positions and velocities $(x_0 \text{ et } v_0)$

$$x(t) = v \cdot t + x_0 = a \cdot \frac{t^2}{2} + v_0 t + x_0$$

小结

$$m_i \frac{\partial^2 \vec{r}_i}{\partial t^2} = \vec{F}_i$$

$$\vec{F}_{i} = -\frac{\partial V}{\partial \vec{r}_{i}}$$

力场

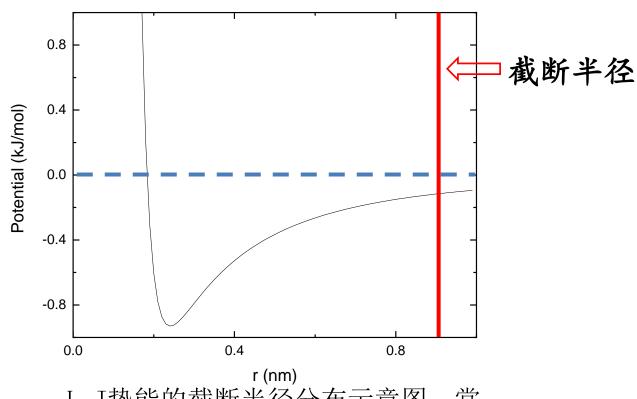

简谐模型,比如键的伸缩振动能

$$V_{\rm B}(r) = \frac{1}{2} k (r - b_0)^2$$

力场: 势能函数的表达式和其中的参数。

势能的处理方法

L-J势: 短程作用, 只计算截断半径内的部分

L-J势能的截断半径分布示意图:常见取值为0.9-1.2 nm

Coulomb势: 截断半径内在实空间计算; (长程作用) 截断半径外通过傅里叶变换计算。
